PROFILE

Final-semester Software Engineering student with hands-on experience installing, deploying and running production systems: Linux and Windows servers, containers, continuous deployment, databases, networking and user support. I work across hardware, server and application, and I document what I leave behind so someone else can run it. I use AI daily as a work tool and review and validate what it produces. Outside work I build mods, bots and servers for gaming communities and friends, documented so anyone can install and use them.

EXPERIENCE

Software Engineering Apprentice · IMEVI *Aug 2026 – present*

- Deployed and run the company intranet in production (Spring Boot, PostgreSQL): absence management, sick leave, occupational-safety KPIs (Res. 0312), employee benefits, IT assets and two-factor authentication.
- Built the CI/CD pipeline with GitHub Actions: every change is tested and deployed automatically to the cPanel server; if the new version fails to start, the server rolls back on its own.
- Ran the first production version on a Docker mini PC on the local network, then led the migration to the company server.
- Migrated the Omega warranty system from Strapi to Express + PostgreSQL, including the production cut-over plan and the transfer of 8,000+ attachments.
- Built features for the Sterilization Portal (instrument traceability: QR scanning, batches, sterilizer cycles, dispatch to branches).

Development & IT Intern · Austral Lens *Sep 2024 – Feb 2025 · Feb – Mar 2026*

- Internship: designed and deployed the centralized IT support ticket system for all branches (Java, MariaDB), with roles, attachments and full history.
- Physically set up and configured the on-premise server (Ubuntu Server), then migrated the whole environment to Windows Server 2019.
- 2026 project: migrated the system to Spring Boot + MySQL with Spring Security, email verification, real-time notifications (WebSocket), HTTPS with custom certificates and a user/ticket data migration script.

AI Training & Evaluation · Outlier AI *Jun – Nov 2024*

- Reviewed, fixed and validated AI-generated code (Python, TypeScript, Java): runtime errors, logic flaws and missed requirements.
- Designed and tested prompts to evaluate model behavior and correctness.

PROJECTS

UmamusumeX: private server for Umamusume: Pretty Derby *2026*

Reverse engineering · Python · Linux/Proton · Ghidra

- Lead contributor (170+ commits) to one of the first private servers for the Global (Steam) release, rebuilt by reverse engineering the client: 357 endpoints, native race engine, gacha, events and a control panel.
- Diagnosed and fixed ~30 bugs (client softlocks, login failures, timezone drift, TLS certificate issues) and documented each with root cause and scope.
- Automated Linux/Proton setup (install and revert scripts, CA trust in the Wine prefix) and added event and banner management to the panel.

Archipelago world for Umamusume *2026*

Community · Python

- Integrated the game with Archipelago (cross-game multiworld randomizer) on top of the private server: every race won sends items to other players. 12+ releases published, with install and options guides written for non-technical players.

SkinShare: Garry's Mod addon *2026*

Community · Lua

- One player picks a skin from their Workshop addons and everyone else downloads and mounts it mid-game, no restart; only the host installs it. 3D preview picker, favorites, works in any gamemode.

SCENE-BOT: community Discord bot *2026*

Collaborator · Rust

- Ported the whole bot from Node.js to Rust (serenity, songbird) while keeping existing server configs, and added fully local voice (Piper TTS, RVC, whisper.cpp) plus an AI roleplay mode.

Home lab & self-hosted infrastructure *personal*

- Linux mini PC as a server: Docker, PostgreSQL, music server and game servers for friends (Project Zomboid, among others) and a local LLM (llama.cpp); remote access over Tailscale.
- Reverse proxy with FRP on a Google Cloud VPS, a VM on Oracle Cloud, and self-hosted DNS with AdGuard Home (DNS over HTTPS).
- Wake-on-LAN across NAT through a relay, and a Wi-Fi hotspot using a patched driver built via DKMS.

Inventory stockout forecasting *2026*

Academic · Python · TensorFlow · FastAPI

- Excel-to-database pipeline, GRU/LSTM models benchmarked against Croston/SBA and Monte Carlo simulation, served by an API consumed from Spring Boot.

EDUCATION

Software Engineering · Universidad Manuela Beltrán *2022 – 2026 (8th and final semester)*

TECHNICAL SKILLS

Systems: Linux (Ubuntu Server, Arch, Fedora), Windows Server 2019, Docker, nginx, cPanel, systemd

Networking: DNS, reverse proxy, VPN (Tailscale, OpenVPN), NAT and port forwarding, TLS/certificates, Wake-on-LAN

Cloud: Oracle Cloud, Google Cloud

Databases: PostgreSQL, MySQL/MariaDB, SQLite

Automation: GitHub Actions (CI/CD), Git, Bash, Python

Development: Java/Spring Boot, JavaScript/Node.js, Python

Other: Reverse engineering (Ghidra), AI tools (Claude, ChatGPT, Copilot, Cursor)
